

Read CONTEXT.md top to bottom, then read session2.md (file is in /Users/Nic/Desktop/Greenqubes AI/greenqubes-ops/docs). We're starting Session 2: DB schema + RLS. The scaffold is complete (Next.js 15, Supabase client, design tokens, i18n stubs, all feature folders). Your job this session is to write the three SQL migration files (0001_schema.sql, 0002_rls.sql, 0003_indexes.sql) in supabase/migrations/, then walk me through applying them in the Supabase dashboard, enabling the pgvector extension, and writing the demo seed data. Wait for my confirmation that you've read both files before starting.
